Verizon reps claim the company has no authority to block spoofed [caller id] numbers.

Yet - I am able to block [only 100] incoming #s using the vz web acct mgt page. VZ suggests a 3rd party- nomorobo.com as a better way to remediate call blocking. When one sets up an acct w/nomorobo - one sets up simultaneous ring for nomorobo - then the service can compare the apparent caller id w/their database. What will happen when valid phone #s end up blocked after nomorobo's customers report a number [that was spoofed]? We are aware that Stateful Packet Inspection technology would make it trivially easy for VZ and other carriers to block any & all [unlawful] spoofed #s. Why are they not required to do so?
