

FCC Narrative

AirScan, Inc. will be conducting camera operator training and equipment testing flights that will be providing full motion video transmission to our headquarters via the frequencies requested. Our standard flying altitude is approximately 2500 to 5000 ft. AGL. The training and testing flights mainly occur over the unoccupied swamp areas that are outlined in the map exhibit. The takeoff and landing paths carry our aircraft over inhabited areas, but we do not require video transmission over those areas.
