

The goal of the program is to further develop and refine the Advanced Antenna System (AAS) known as the Freestar 5G. This is a telecom communications antenna platform; we *ARE NOT* conducting any directed energy / jamming / electronic attack / spoofing / emulating operations.

The AAS system will be connected to software defined radios and 5G waveforms for testing.

The AAS offers the potential to provide entirely new options to equipment manufacturers. The advancement will enable new capabilities in telecom applications.
