

### Frequency Coordination and Interference Analysis

With regard to the proposed operation at 2025–2110 MHz, prior coordination will be made with the SBE local and national frequency coordinators. The applicant is aware that other stations may be licensed on these frequencies and if any interference occurs, the applicant will immediately shut down.

With regard to the proposed operation on TV Channel 31, interference analysis using TV Study shows zero unique population interference. See results below. Additionally, because the operation will be indoors, the potential for interference is further reduced due to building wall loss. The applicant is aware that other stations are licensed on this channel and if any interference occurs, the applicant will immediately shut down.
