7.18.1   GENERAL
  D.   Rate Categories (Cont'd)

  5.   Amplifier Node

  This Optical Amplification provides required strengthening of the optical signals
  or wavelengths to support greater distances that are beyond the reach of the
  normal DWDM optical signals. Traffic cannot be added or dropped from an
  Amplifier Node. The Company will determine the location of the wire center
  where the Amplifier Node will be placed based upon design.

  6.   Transport Channel

  The Transport Channel rate category provides for the transmission facilities
  between SWCs for a Premise Node and/or a CO Node. If there is just one SWC
  or CO Node in the configuration the mileage is zero.

  If there are two or more SWCs and/or CO Nodes, the mileage for the application
  will be the air line miles between each of the SWCs and/or CO Nodes, calculated
  on a V and H basis. The mileage is not doubled to reflect protected or diverse
  paths.

  Example: If a configuration consists of three SWCs at points A, B and C, then
  the mileage would be calculated on the air line miles from A to B, from B to C
  and from C to A. If location C was not an SWC then B to C and C to A would
  not be calculated.
