FOOTNOTES:

The Current Year Maximum Average Rates for Res, SLB, and MBL are calculated using an iterative process. The initial values for each of the rates are calculated by dividing the percentage of the eligible revenue attributed to each rate type by the ARC Eligible Tariff Period Projected Lines for each rate type. The percentage of the eligible revenue attributed to each rate type is calculated as the ratio of the Maximum ARC opportunity Revenue for a rate type to the Total Maximum ARC opportunity Revenue for all rate types. The initial values are calculated using all the eligible lines and revenues from all exchanges. Each successive value for each of the rates is calculated by removing the revenue and lines for exchanges with Maximum ARC rates below the most recently calculated values for the rates. This process is repeated until no more exchanges are removed from the calculations for any the rates. These calculations are shown on columns L through R of this tab.
